FARM EMPLOYMENT DOWN SLIGHTLY FROM YEAR AGO

There was a total of 11,040,000 people working on farms the first of September, 4 percent less than a year earlier and 8 percent less than the 1935-39 September 1 average, the U. S. Department of Agriculture reported today. Employment was lower this year than last in all the geographic regions but the greatest decline was in the East South Central Region where there were 9 percent fewer workers on farms than on the first of September a year ago. Farm activity is generally greater on September 1 than a month earlier and the 4 percent increase this year was about the same as usual.

The number of unpaid family workers dropped only 2 percent from September 1943 but hired farm employment in the U. S. was off 9 percent from that date. The East South Central Region reported the sharpest reduction; the number of hired workers on September 1 was 22 percent fewer than a year earlier. This curtailment in hired employment in the South is due primarily to the fact that the cotton crop did not mature as rapidly as last season and to rains around the first of the month which prevented most field work in this area. For the country as a whole, paid workers represented 25.5 percent of the total number of farm workers, compared to 27.0 percent at this time last year.

A slightly shorter work day put in by farm operators and hired "hands" indicates that the farm labor situation September 1 was not quite so critical as a year ago. In September last year, it was reported that farm operators were working 12.4 hours per day; now the average is 12.1 hours. The length of the current work day of hired workers is 10.0 hours compared to 10.2 hours a year earlier. Although these declines are small, there are comparable declines in all nine of the geographic regions. Despite these small decreases from last year the working day on farms is still longer than in September 1939.

New England: Farm employment in this area at the turn of the month was down 7 percent from last September, the greatest decline for any region except the East South Central. Experienced, able-bodied farm workers needed for the harvest of cranberries, apples, and potatoes, and for filling silos are very scarce this year. School boys and girls have been widely employed on farms during the summer and, in some cities, school officials have arranged for farm-employed boys and

girls to continue work under certain circumstances. Up to this time, cutbacks in industrial war contracts appear to have had little effect on the supply of labor available for farm employment in New England. Prisoners of war are being used to an increasing extent for some jobs on farms, and plans are progressing for more extensive farm use of this type of labor.

With the hot, dry weather, silage corn is maturing earlier than usual and silo filling is getting under way earlier so the harvest job can be spread over a longer period, thus minimizing the need for additional labor.

The length of work day for farm operators in New England averaged 12.3 hours on September 1, ranging from 11.7 to 12.8 hours per day, by States, and is little changed from previous reports. The length of work day for hired workers varies between 9.5 and 10.0 hours per day for most New England States and averages 9.9 hours for the region as a whole. In Vermont, where dairying predominates, the length of work day of hired workers is longer and averages about 11 hours per day.

Middle Atlantic Region: Family employment remained unchanged from a year ago but the number of hired workers on farms in the Middle Atlantic Region declined 11 percent from September 1, 1943. Lowered yields of a number of crops this year reduced labor requirements in the Middle Atlantic Region with the result that fewer workers were needed at harvest than had been anticipated.

North Central: Total farm employment declined only slightly from last September but the number of hired workers decreased about 10 percent in the West-North Central States. Farm activity in the Middle West is usually at somewhat of a lull the first of September, and this situation was accentuated this year because the harvest of truck crops, potatoes, and fruit was later than usual and also because the dry weather in some sections delayed fall plowing. Exchange of work between farms has become a standard practice in many areas and this in some cases obviates the necessity of hiring help, reducing the number of hired workers. The length of work day for both operators and hired "hands" is somewhat more in the North Central States than the U. S. average, and the indications are that farmers in the North Central area, west of the Mississippi River put in a little longer day than do those east of the river.

South Atlantic and South Central States: Total farm employment in the South Atlantic and West South Central Regions sagged slightly the first of September compared to the same date in 1943 but declined more than 9 percent in the East South Central Region. The fall in number of farm workers in the East South Central Region resulted primarily from a 22-percent reduction in hired help from September 1, 1943. Over much of this area, rains around the first of the month made the ground too wet for plowing for winter cover crops, cotton too wet for picking, and revived the tobacco plants so that very little tobacco was cut. The length of day for hired farm workers has not varied greatly in the South the past few years, and operators are working fewer hours per day than last September and about the same as in 1939.

Mountain States: A 10-percent drop in hired employment from September 1, 1943 to the same date this year highlights the farm labor situation in the Mountain States. There are more farm youths in the army than there were a year ago because of changes in draft regulations and there continues to be some out-movement of farm workers to urban jobs. Wages are reported to be high and farmers are apparently relying on their own efforts and those of their family rather than hire or attempt to hire additional field hands. There were 9,926 Mexican Nationals working on farms in this region on August 31. They are employed primarily in peak harvesting of war essential crops although some are used for general types of farming whenever opportunity permits.

Pacific Region: The farm labor situation on the West Coast appears to be about the same as in September a year ago. Hired employment is down slightly but the number of unpaid family workers is the same as last September. The hours worked per day on farms also remained practically unchanged from a year ago. There were about 41,133 Mexican Nationals on farms in the Pacific Coast States at the turn of the month and, although they represent only a small percentage of the total farm labor force, their mobility makes for efficient and near-maximum utilization of their efforts.
